Oral and Inhalation developmental toxicity studies were conducted in pregnant rats and rabbits with PGMEA (1-Methoxy-2-propanol acetate) containing approximately 2% beta isomer (cited in 1-METHOXY-2-PROPANOL ACETATE OECD SIDS Report). No statistically significant effects were noted in developmental parameters at any of the dose levels tested (Oral study - up to 1,000 mg/kg/day and inhalation study - up to 4000 ppm).

**Data for 2-Methoxy-1-propanol acetate (70657-70-4)**

Acute inhalation toxicity : Data refers to Beta Isomer

**Toxicology Assessment**

CMR effects : Teratogenicity:  
The beta isomer, 2-Methoxy-1-propanol acetate, was tested by itself for developmental/teratogenic effects in pregnant rats and rabbits. Developmental/teratogenic effects were observed in both species via the inhalation route of exposure. In rabbits, the effects only occurred in the highest dose group (545 ppm) in absence of any significant maternal toxicity. In rats, these effects were also only observed in the highest dose group, but in the presence of significant maternal toxicity, which placed the cause of the developmental effects in question. The No Observable Adverse Effect Level, NOAEL, for the inhalation exposures in rabbits with the pure beta isomer was determined to be 145 ppm, this equates to exposure of 1-Methoxy-2-propanol acetate with a level of beta isomer > 2%. Since this Product formulation contains < 0.3% of the beta isomer, it is judged that exposure to this product formulation does not pose a reproductive hazard.
